

matlab quaternion class

`quaternion.m` is a matlab class that implements quaternion mathematical operations, 3 dimensional rotations, transformations of rotations among several representations, and numerical propagation of Euler's equations for rotational motion. All `quaternion.m` class methods except `PropagateEulerEq` are fully vectorized.

Quaternions are a generalization of complex numbers. Quaternions have the form

$$q = e_1 + i \cdot e_2 + j \cdot e_3 + k \cdot e_4$$

where e_1, e_2, e_3, e_4 are real, and

$$i \cdot j = k, j \cdot i = -k, j \cdot k = i, k \cdot j = -i, k \cdot i = j, i \cdot k = -j, i \cdot i = j \cdot j = k \cdot k = -1.$$

Normalized quaternions can represent rotations in 3 dimensional space, and offer several conveniences over other representations of rotations. Other representations of 3D rotations include:

- angle-axis, an axis vector, and a rotation angle around that axis
- Euler angles, a set of 3 orthogonal body axes and 3 rotation angles about those axes
- Rotation or Direction Cosine Matrices, 3x3 orthogonal matrices

The convention used in this matlab class is that all rotation operations operate from left to right on 3x1 column vectors and create rotated vectors, not representations of those vectors in rotated coordinate systems.

Euler's equations are 3 coupled nonlinear differential equations for 3 orthogonal body angular accelerations as a function of the 3 body angular rotation rates (ω), 3 principal moments of inertia (I), and 3 torques (τ):

$$\begin{bmatrix} \dot{\omega}_1 \\ \dot{\omega}_2 \\ \dot{\omega}_3 \end{bmatrix} = \begin{bmatrix} \omega_2 \omega_3 (I_{22} - I_{33}) / I_{11} \\ \omega_3 \omega_1 (I_{33} - I_{11}) / I_{22} \\ \omega_1 \omega_2 (I_{11} - I_{22}) / I_{33} \end{bmatrix} + \begin{bmatrix} \tau_1 / I_{11} \\ \tau_2 / I_{22} \\ \tau_3 / I_{33} \end{bmatrix}$$

Euler's equations have complicated solutions, particularly in the case of torques, that make them most conveniently solved numerically.

The class help text for `quaternion.m`, which implements all of these functions, is printed below.

Examples

```
>> q = quaternion( [1,2,3,4] )
q      = (1          ) + i(2          ) + j(3          ) + k(4          )
>> qn = q.normalize
qn      = (0.18257    ) + i(0.36515    ) + j(0.54772    ) + k(0.7303    )
>> [angle, axis] = qn.AngleAxis
angle =
    2.7744
axis =
    0.37139
    0.55709
    0.74278
>> angles = qn.EulerAngles( '123' )
angles =
    1.4289
   -0.33984
    2.3562
>> R = qn.RotationMatrix
R =
   -0.66667    0.13333    0.73333
    0.66667   -0.33333    0.66667
    0.33333    0.93333    0.13333
>> equiv( qn, quaternion.angleaxis( angle, axis ))
ans =
    1
>> equiv( qn, quaternion.eulerangles( '123', angles ))
ans =
    1
>> equiv( qn, quaternion.rotationmatrix( R ), eps(2) )
ans =
    1
```

quaternion.m help

classdef quaternion, implements quaternion mathematics and 3D rotations

Properties (SetAccess = protected):

e(4,1) components, basis [1; i; j; k]: e(1) + i*e(2) + j*e(3) + k*e(4)
i*j=k, j*i=-k, j*k=i, k*j=-i, k*i=j, i*k=-j, i*i = j*j = k*k = -1

Constructors:

q = quaternion scalar zero quaternion, q.e = [0;0;0;0]
q = quaternion(x) x is a matrix size [4,s1,s2,...] or [s1,4,s2,...],
q is size [s1,s2,...], q(i1,i2,...).e = ...
x(1:4,i1,i2,...) or x(i1,1:4,i2,...).'

q = quaternion(v) v is a matrix size [3,s1,s2,...] or [s1,3,s2,...],
q is size [s1,s2,...], q(i1,i2,...).e = ...
[0;v(1:3,i1,i2,...)] or [0;v(i1,1:3,i2,...)].'

q = quaternion(c) c is a complex matrix size [s1,s2,...],
q is size [s1,s2,...], q(i1,i2,...).e = ...
[real(c(i1,i2,...));imag(c(i1,i2,...));0;0]

q = quaternion(x1,x2) x1,x2 are matrices size [s1,s2,...] or scalars,
q(i1,i2,...).e = [x1(i1,i2,...);x2(i1,i2,...);0;0]

q = quaternion(v1,v2,v3) v1,v2,v3 matrices size [s1,s2,...] or scalars,
q(i1,i2,...).e = [0;v1(i1,i2,...);v2(i1,i2,...);...
v3(i1,i2,...)]

q = quaternion(x1,x2,x3,x4) x1,x2,x3,x4 matrices size [s1,s2,...] or scalars,
q(i1,i2,...).e = [x1(i1,i2,...);x2(i1,i2,...);...
x3(i1,i2,...);x4(i1,i2,...)]

Quaternion array constructor methods:

q = quaternion.eye(N) quaternion NxN identity matrix
q = quaternion.nan(siz) q(:).e = [NaN;NaN;NaN;NaN]
q = quaternion.ones(siz) q(:).e = [1;0;0;0]
q = quaternion.rand(siz) uniform random quaternions, NOT normalized
to 1, 0 <= q.e(1) <= 1, -1 <= q.e(2:4) <= 1
q = quaternion.randRot(siz) random quaternions uniform in rotation space
q = quaternion.zeros(siz) q(:).e = [0;0;0;0]

Rotation constructor methods (all lower case):

```
q = quaternion.angleaxis(angle,axis)
```

angle is an array in radians, axis is an array of vectors size [3,s1,s2,...] or [s1,3,s2,...], q is size [s1,s2,...], quaternions normalized to 1 equivalent to rotations about axis by angle

```
q = quaternion.eulerangles(axes,angles) or
q = quaternion.eulerangles(axes,ang1,ang2,ang3)
```

axes is a string array or cell string array, '123' = 'xyz' = 'XYZ' = 'ijk', etc., angles is an array of Euler angles in radians, size [3,s1,s2,...] or [s1,3,s2,...], or (ang1, ang2, ang3) are arrays or scalars of Euler angles in radians, q is size [s1,s2,...], quaternions normalized to 1 equivalent to Euler Angle rotations

```
q = quaternion.rotateutov(u,v,dimv,dimv)
```

quaternions normalized to 1 that rotate 3 element vectors u into the directions of 3 element vectors v

```
q = quaternion.rotationmatrix(R)
```

R is an array of rotation or Direction Cosine Matrices size [3,3,s1,s2,...] with $\det(R) = 1$, $q(i1,i2,...) =$ quaternions normalized to 1, equivalent to $R(1:3,1:3,i1,i2,...)$

Rotation methods (Mixed Case):

```
[angle,axis] = AngleAxis(q)
```

angles in radians, unit vector rotation axes equivalent to q

```
qd = Derivative(q,w)
```

quaternion derivatives, w are 3 component angular velocity vectors

```
angles = EulerAngles(q,axes)
```

angles are 3 Euler angles equivalent to q, axes are strings or cell strings, '123' = 'xyz', etc.

```
[omega,axis] = OmegaAxis(q,t,dim)
```

instantaneous angular velocities and rotation axes

```
PlotRotation(q,interval)
```

plot columns of rotation matrices of q,

	pause interval between figure updates in seconds
<code>[q1,w1,t1] = PropagateEulerEq(q0,w0,I,t,@torque,odeoptions)</code>	Euler equation numerical propagator, see help quaternion.PropagateEulerEq
<code>vp = RotateVector(q,v,dim)</code>	vp are 3 component vectors, rotations q acting on vectors v, uses rotation matrix multiplication
<code>vp = RotateVectorQ(q,v,dim)</code>	vp are 3 component vectors, rotations q acting on vectors v, uses quaternion multiplication, RotateVector is 7 times faster than RotateVectorQ
<code>R = RotationMatrix(q)</code>	3x3 rotation matrices equivalent to q

Note:

In all rotation operations, the rotations operate from left to right on 3x1 column vectors and create rotated vectors, not representations of those vectors in rotated coordinate systems.

For Euler angles, '123' means rotate the vector about x first, about y second, about z third, i.e.:

```
vp = rotate(z,angle(3)) * rotate(y,angle(2)) * rotate(x,angle(1)) * v
```

Ordinary methods:

<code>n = abs(q)</code>	quaternion norm, <code>n = sqrt(sum(q.e.^2))</code>
<code>q3 = bsxfun(func,q1,q2)</code>	binary singleton expansion of operation func
<code>c = complex(q)</code>	complex(real(q), imag(q))
<code>qc = conj(q)</code>	quaternion conjugate, <code>qc.e = [q.e(1);-q.e(2);-q.e(3);-q.e(4)]</code>
<code>qt = ctranpose(q)</code>	<code>qt = q'</code> ; quaternion conjugate transpose, 2-D (or scalar) q only
<code>qp = cumprod(q,dim)</code>	cumulative quaternion array product over dimension dim
<code>qs = cumsum(q,dim)</code>	cumulative quaternion array sum over dimension dim
<code>qd = diff(q,ord,dim)</code>	quaternion array difference, order ord, over dimension dim
<code>ans = display(q)</code>	'q = (e(1)) + i(e(2)) + j(e(3)) + k(e(4))'
<code>d = dot(q1,q2)</code>	quaternion element dot product, <code>d = dot(q1.e,q2.e)</code>
<code>d = double(q)</code>	<code>d = q.e</code> ; if <code>size(q) == [s1,s2,...]</code> , <code>size(d) == [4,s1,s2,...]</code>
<code>l = eq(q1,q2)</code>	quaternion equality, <code>l = all(q1.e == q2.e)</code>

<code>l = equiv(q1,q2,tol)</code>	quaternion rotational equivalence, within tolerance <code>tol</code> , <code>l = (q1 == q2) (q1 == -q2)</code>
<code>qe = exp(q)</code>	quaternion exponential, <code>v = q.e(2:4)</code> , <code>qe.e = exp(q.e(1))*[cos(v);v.*sin(v)./ v]</code>
<code>ei = imag(q)</code>	imaginary e(2) components
<code>qi = interp1(t,q,ti,method)</code>	interpolate quaternion array
<code>qi = inverse(q)</code>	quaternion inverse, <code>qi = conj(q)./norm(q).^2</code> , <code>q .* qi = qi .* q = 1</code> for <code>q ~= 0</code>
<code>l = isequal(q1,q2,...)</code>	true if equal sizes and values
<code>l = isequaln(q1,q2,...)</code>	true if equal including NaNs
<code>l = isequalwithqualnans(q1,q2,...)</code>	true if equal including NaNs
<code>l = isfinite(q)</code>	true if all(<code>isfinite(q.e)</code>)
<code>l = isinf(q)</code>	true if any(<code>isinf(q.e)</code>)
<code>l = isnan(q)</code>	true if any(<code>isnan(q.e)</code>)
<code>ej = jmag(q)</code>	e(3) components
<code>ek = kmag(q)</code>	e(4) components
<code>q3 = ldivide(q1,q2)</code>	quaternion left division, <code>q3 = q1 \. q2 = inverse(q1) *. q2</code>
<code>q1 = log(q)</code>	quaternion logarithm, <code>v = q.e(2:4)</code> , <code>q1.e = [log(q);v.*acos(q.e(1)./ q)./ v]</code>
<code>q3 = minus(q1,q2)</code>	quaternion subtraction, <code>q3 = q1 - q2</code>
<code>q3 = mldivide(q1,q2)</code>	left division only defined for scalar <code>q1</code>
<code>qp = mpower(q,p)</code>	quaternion matrix power, <code>qp = q^p</code> , <code>p</code> scalar integer ≥ 0 , <code>q</code> square quaternion matrix
<code>q3 = mrdivide(q1,q2)</code>	right division only defined for scalar <code>q2</code>
<code>q3 = mtimes(q1,q2)</code>	2-D matrix quaternion multiplication, <code>q3 = q1 * q2</code>
<code>l = ne(q1,q2)</code>	quaternion inequality, <code>l = ~all(q1.e == q2.e)</code>
<code>n = norm(q)</code>	quaternion norm, <code>n = sqrt(sum(q.e.^2))</code>
<code>[q,n] = normalize(q)</code>	make quaternion norm == 1, unless <code>q == 0</code> , <code>n = matrix of previous norms</code>
<code>q3 = plus(q1,q2)</code>	quaternion addition, <code>q3 = q1 + q2</code>
<code>qp = power(q,p)</code>	quaternion power, <code>qp = q.^p</code>
<code>qp = prod(q,dim)</code>	quaternion array product over dimension <code>dim</code>
<code>qp = product(q1,q2)</code>	quaternion product of scalar quaternions, <code>qp = q1 .* q2</code> , noncommutative
<code>q3 = rdivide(q1,q2)</code>	quaternion right division, <code>q3 = q1 ./ q2 = q1 .* inverse(q2)</code>

<code>er = real(q)</code>	real e(1) components
<code>qs = slerp(q0,q1,t)</code>	quaternion spherical linear interpolation
<code>qr = sqrt(q)</code>	<code>qr = q.^0.5</code> , square root
<code>qs = sum(q,dim)</code>	quaternion array sum over dimension dim
<code>q3 = times(q1,q2)</code>	matrix component quaternion multiplication, <code>q3 = q1 .* q2</code> , noncommutative
<code>qm = uminus(q)</code>	quaternion negation, <code>qm = -q</code>
<code>qp = uplus(q)</code>	quaternion unitary plus, <code>qp = +q</code>
<code>ev = vector(q)</code>	vector e(2:4) components

quaternion.PropagateEulerEq help

`function [q1, w1, t1] = PropagateEulerEq(q0, w0, I, t, torque, odeoptions)`

Inputs:

<code>q0</code>	initial orientation quaternion (normalized, scalar)
<code>w0(3)</code>	initial body frame angular velocity vector
<code>I(3)</code>	principal body moments of inertia (if no torque, only ratios of elements of I are used)
<code>t(nt)</code>	initial and subsequent (or previous) times <code>t = [t0,t1,...]</code> (monotonic)
<code>@torque [OPTIONAL]</code> function handle to calculate torque vector: <code>tau(1:3) = torque(t, y),</code> where <code>y = [q.e(1:4); w(1:3)]</code>	
<code>odeoptions [OPTIONAL]</code> ode45 options	

Outputs:

<code>q1(1,nt)</code>	array of normalized quaternions at times <code>t1</code>
<code>w1(3,nt)</code>	array of body frame angular velocity vectors at times <code>t1</code>
<code>t1(1,nt)</code>	array of output times

Calls:

<code>Derivative</code>	quaternion derivative method
<code>odeset</code>	matlab ode options setter
<code>ode45</code>	matlab ode numerical differential equation integrator
<code>torque [OPTIONAL]</code> user-supplied torque as function of time, orientation, and angular rates; default is no torque
